Abstract

The print and electronic media is bombarded with models exhibiting perfect smiles. People are giving a lot of importance to the red and white aesthetics i.e., the teeth and the gums. Multiple options are available to treat the problems arising in the highly aesthetic zone. The use of porcelain laminates veneers to solve aesthetic and/or functional problems has been shown to be a valid management option especially in the anterior aesthetic zone. This Case report discusses a patient having diastema in the anterior region with discoloured and chipped off old composite restorations. The patient was treated with porcelain laminate veneers in the maxillary arch for the same.
